

Immulina[®] +D₃

Syrup

Short Product Characteristic

There are periods in a person's life when taking care of immunity is particularly important. This is primarily the period of early childhood, i.e. from the first year of life to puberty, when the immune system is still forming and maturing. Immulina+D₃ in the form of syrup has been developed just for children, so that the preparation can be easily and conveniently administered to the child in this form.

Immulina+D₃ provides vitamins (C and D₃) and minerals (zinc and selenium) essential for the proper functioning of the immune system. Smaller children might be particularly sensitive to vitamin D₃ and selenium. Therefore, their doses in the syrup have been adjusted so that the syrup can be used safely in smaller children.

Immulina still provides rutosides (rutin and hesperidin) from acerola fruit extract with beneficial effects on blood vessels and mucous membranes, and most importantly, two special ingredients (lipopolysaccharide from spirulina extract and beta-glucan from baker's yeast extract) with immune-boosting effects for children. These ingredients have been comprehensively tested in the best medical centers of the US and Europe. They are completely safe and activate the entire immune system, preparing it for rapid and effective action.
